How to Use This Manual

This manual collects **536 ready-to-paste prompts** for AI video generators, organised into three parts that mirror how a director thinks about a shot:

- **Part One — Camera Shots.** Shot sizes, angles, movement, lenses, aerials, cranes, POV and transitions. Use these to learn and lock down the camera language.
- **Part Two — Video Feel.** Lighting, color grades, film stocks, genre looks, animation styles, mood, weather and time manipulation. Use these to control how footage *feels*.
- **Part Three — Scene Prompts.** Complete scenes across worlds, action, macro, character, product, nature, sci-fi, fantasy, horror, food, sports, music, period, everyday life, timeline sequences and vertical social video.

Every prompt stands on its own. Copy it as-is, or treat it as a template: keep the camera and light language and swap in your own subject.

The Prompt Formula

The strongest prompts in this manual follow the same order. Models weight early words most, so lead with the shot and the subject.

1	Shot + camera	Slow dolly in, low-angle tracking shot, drone rising...
2	Subject	A lighthouse keeper, a matte-black supercar, a snow leopard...
3	Action	Reading a letter, drifting through a corner, stalking prey...
4	Setting	Rain-streaked window at night, Icelandic black-sand beach...
5	Light + color	Golden-hour backlight, neon noir, teal-and-orange grade...
6	Style + format	35mm film grain, anamorphic 2.39:1, claymation, 9:16 vertical...

Example, built with the formula:

Slow dolly in → on an elderly clockmaker → tightening a tiny gear with tweezers → in a cluttered workshop at night → lit by a single green desk lamp, warm amber grade → 35mm film grain, shallow depth of field.

Ten Rules That Make Prompts Work

- One camera move per clip. Chain clips for complex moves instead of stacking three in one prompt.
- Say *dolly* when you want parallax and *zoom* when you want optical magnification — models treat them differently.
- Name where the shot lands: “ending on the castle,” “land on the open doorway.” An end frame prevents drift.
- Give moving subjects a direction of travel so camera and subject agree.
- Describe light by source, direction and quality: “hard side light from a window,” not just “good lighting.”
- Use one clear emotion and one clear action for performances. Too many beats blur the acting.
- Ask for *subtle* handheld sway. Heavy shake often reads as a glitch.
- For timeline prompts, keep beats 1–3 seconds apart and describe each beat visually.
- For vertical video, say “framed for vertical 9:16” and keep the subject centered with vertical motion.
- Use negative prompts (see the appendix) to remove competing motion such as unwanted zoom or camera shake.

Appendix A — Negative Prompt Cheat Sheet

If your generator supports a negative prompt, rule out the motions that compete with the one you asked for. Pair each move with its negatives:

Static / locked-off	camera movement, zoom, pan, tilt, camera shake, handheld sway
Pan / tilt	dolly movement, zoom, camera shake, tilted horizon
Zoom	dolly movement, parallax shift, pan, camera shake
Dolly in / out	zoom, pan, tilt, orbit, change in height, camera shake
Truck / pedestal	pan, rotation, tilt, zoom, orbit, crane arc
Orbit / arc	zoom, change in radius, change in height, subject turning with camera, cuts
Tracking / follow	static camera, zoom, cuts, subject leaving frame, erratic shake
Whip / crash zoom	slow pan, multiple zooms, blurry final frame, drifting framing
Handheld	violent shaking, gimbal-smooth motion, zoom
Any shot (quality)	warped hands, extra fingers, morphing faces, flickering, text artifacts, watermark, low resolution, jitter
